

Positioning Systems

Linear Motor Systems

Positioning Systems

Linear Motor Systems

HIWIN positioning systems facilitate positioning that is accurate in terms of time and location. These positioning systems are suitable for installation in a horizontal or vertical position. Due to the direct drive, they are free of backlash, very dynamic and are low maintenance.

Assembly instructions and catalogue for download

Linear Motor Systems

Product overview

1. Product overview

LMSSA

[Page 12](#)

- Short delivery time
- Cost-optimised linear motor axis, based on standardised modular system with reduced number of variants
- With iron-core LMSA motors or with coreless LMC motors
- Stroke length is measured via optical or magnetic distance measuring system incrementally or absolutely depending on requirements

LMX1A

[Page 60](#)

- Complete axis with iron-core motor, type LMSA
- Ideal for applications with high continuous power requirements
- Optional enclosure by metal cover or bellow cover
- Stroke length is measured via optical or magnetic distance measuring system incrementally or absolutely depending on requirements

LMX1E

[Page 76](#)

- Complete axis with coreless motor, type LMC
- Ideal for applications with a high degree of synchronization requirements
- Optional enclosure by metal cover or bellow cover
- Stroke length is measured via optical distance measuring system incrementally or absolutely

LMV

[Page 86](#)

- Highly dynamic positioning axis, for vertical and horizontal applications
- Compact, zero-play setup
- Maximised mechanical rigidity
- Protected against dust

Cross tables

[Page 88](#)

- Combination of axes from the LMX series

Gantry systems

[Page 91](#)

- Standardized gantry systems

Linear Motor Systems

General information

2. General information

2.1 Glossary

Acceleration

This is the speed change per time unit, that is
 $\text{acceleration} = \text{speed}/\text{time}$ or $a = v/t$.

Acceleration time

This is defined as the time that a drive requires to reach maximum speed from standstill.

Accuracy (absolute accuracy)

This, or the actual inaccuracy, corresponds to the deviation between a targeted position and the actual position. The accuracy along an axis is defined as the difference between the actual and target positions after all other linear deviations that can be eliminated have been excluded. Such systematic and linear deviations are the result, for example, of cosine errors, angle deviations, shaft lead errors, thermal expansion etc. Accuracy is calculated for all relevant target positions of an application using to the following formula:

Maximum of all sums of systematic target-actual deviations + 2 sigma (standard deviation). Accuracy must not be confused with \triangleright repeatability.

Back EMF constant K_v

This is the relation between the back EMF voltage (rms) and the motor rotational speed or speed (rpm or m/s). Back EMF is the electromagnetic force that is created during the movement of windings in the magnetic field of permanent magnets, e.g. in a servo motor.

Continuous torque, continuous force F_c

A motor can produce continuous torque or nominal torque (with rotational movements) and continuous force or nominal force (with linear movements) in continuous operation (duty cycle = 100 %).

Continuous current I_c

This is the current supplied over a longer period; the maximum permitted continuous current per winding is referred to as the nominal current. The continuous current is characterized by the fact that the dissipation power results in motor warming of T_{max} .

Eccentricity

This is the deviation of the center point of rotation of rotary tables from its position during rotation. It is created by centering and bearing tolerances.

Flatness

This is a measure for the vertical straightness of a movement on the X-axis. A deviation from the absolute levelness is a shift on the Z-axis when moving on the X-axis.

Force, torque

Force (in linear movements) or torque (in rotational movements) is given for defined conditions, e.g. as continuous force or continuous torque at:

- 25 °C ambient temperature
- T_{max} winding temperature
- 100 % operating time for linear motors and torque motors
- 50 % operating time for rotary tables

or as peak force or peak torque.

Force constant K_f

This is the winding-specific parameter used to calculate the resultant force as $F = I \times K_f$ by multiplication with the input current.

Guide deviation

This is the linear deviation from the stroke axis. It is dependent on straightness (thus the accuracy at the level of the table) and flatness (the accuracy external to the level of the table).

Increment

The smallest increment is the minimum stroke that a linear drive can travel repeatedly. It is determined by the \triangleright resolution of the linear drive plus the increment of the motor and all errors in the drive line (reverse play, winding etc.).

Magnetic attraction force F_a

This force is created between the primary and secondary parts of iron-core linear motors, by biasing voltage of the drive system, which must then be taken up by the guide.

Motor constant K_m

This designates the ratio of generated power and dissipation power and consequently is a measure for efficiency of a motor.

Multi-Index

One incremental track is arranged on the scale. The sensor in the encoder head reads out 3 signals: incremental tracks A and B and Z-track for the internal reference signal. Each reference mark on the scale creates a reference signal (multi-index). An external reference switch is essential to trigger the reference signal. After operating the external reference switch the next reference mark on the magnetic scale defines the reference signal.

Peak current I_p

It is used for short-term generation of peak power. HIWIN defines peak current as follows: Iron-core motors have three times the permitted continuous current of the LMS series as I_p , coreless motors have three times the permitted continuous current as I_p . The maximum permitted length of peak current is one second. Thereafter, the motor must cool down to the nominal temperature before peak current can be supplied again.

Peak torque, peak force F_p

The peak torque (for rotational movements) or the peak force (for linear movements) is the maximum force that a motor can generate for approximately one second. With HIWIN, it is at the end of the linear modulation range at peak current I_p and is significant especially during acceleration and braking.

Repeatability

This may not be confused with absolute preciseness. A linear axis can have slight preciseness, but high repeatability. The uni-directional repeatability is measured when there is movement to a target position from an appropriately large stroke in the same direction several times; doing this the other way around does not work. In the measurement of bi-direction repeatability, there is movement to a target position is driven from different movement directions; doing this the other way around does work.

Resolution

This is the smallest stroke that can be detected by the distance measuring system in use. The achievable \triangleright increment is usually higher than the resolution due to additional factors.

Rigidity

This corresponds to the mechanical deformation resistance that a component or assembly has against a static external load in a steady-state, static state (static rigidity) or the elastic deformation resistance that a component or assembly has against a dynamic force working from the outside (dynamic rigidity).

Single-Index

The magnetic scale is split in two tracks, incremental track and index track. Depending on the specification one or several reference marks are located on the index track over the entire travel distance. There are two sensors integrated in the encoder: A sensor for the incremental tracks A and B and a sensor for the Z track that outputs a reference signal when passing over one of the reference marks (single index). Single-index-scales are always custom-made

Straightness

This is a measure for the horizontal straightness of a movement on the X-axis. A deviation from the absolute straightness is a shift on the Y-axis when moving on the X-axis.

Torque

This is the dimension which causes a rotation movement in a body and consequently a vectorial dimension, which can be expressed in the following cross product:

$$\vec{M} = \vec{r} \times \vec{F}_1$$

The torque is expressed physically in the unit $\text{Nm} = \text{kgm}^2/\text{s}^2$.

Wobbling

This is the angle deviation in the rotation axis from rotary tables during rotational movements, i.e. tipping of the surface of a rotary table. The causes are mainly tolerances in the bearing.

Winding resistance R_{25}

This is the winding-specific dimension that is produced by the winding resistance at 25 °C winding temperature. At 80 °C winding temperature, the winding resistance increases to approximately $1.2 \times R_{25}$.

Winding temperature T_{max}

This is the permitted winding temperature. The actual motor temperature is dependent on the installation, cooling and operating conditions and consequently can only be determined in an actual case and cannot be calculated.

2.2 Typical parameters

2.2.1 Winding-independent parameters

- F_a Relatively constant force between primary and secondary part (magnetic basis) that must be handled by a mechanical guide.
- F_c Motor power, which is available in nominal operation as continuous force and which results in warming to T_{max} .
- F_p Motor power that can be generated for a short time, which is reached at I_p at the end of the linear modulation range and results in substantial heating up when there is no cooling.
- K_m Motor constant, which expresses the ratio of generated power and dissipation power and consequently the degree of effectiveness.
- P_v The heat output created in the motor winding, which results in a time-dependent temperature rise dependent on the operating mode (current) and the ambient conditions (cooling). P_v is especially high in the upper modulation range (at I_p) due to the quadratic dependency of current, while only relatively slight warming occurs in the range of the nominal current. P_v is calculated using the motor constant K_m for a movement section with the required force F : $P_v = F/K_m$.
- P_{vp} Peak dissipation power at I_p .
- P_c Dissipation power at I_c .
- T Permissible winding temperature, which is recorded by sensors or thermal circuit breakers; the created motor surface temperature is dependent on
 - the actual installation conditions (table size)
 - the heat dissipation conditions (cooling)
 - the operating mode and consequently the mean performance entry and can only be determined if these variables are known.

2.2.2 Winding-independent parameters

- I_c For generating the current flowing for continuous force.
- I_p For short-term generation of the peak force of flowing peak current.
- K_f Winding dimension, which produces the created force with the current:
 $F = I \times K_f$.
- K_u Winding characteristic that in generator mode returns the armature back voltage generated at the motor terminals as a function of the speed: $U_g = K_u \times v$.
- R_{25} Winding resistance at 25 °C; this increases to approx. 1.2 times the value at 80 °C.

Linear Motor Systems

General information

2.3 Typical properties of linear motor axes

HIWIN linear motor axes are directly driven axes with linear motors, which are designed as a plug and play solution. Standardized energy chains and customized cable guides are available as an option. These are suspended complete axes with distance measuring system, guides, limit switches and optionally with covers as protection against environmental influences. An arresting brake can be built in optionally. Due to the direct drive, the linear axes are free from backlash, very dynamic, low maintenance and can also be equipped with several carriages.

- Several carriages per axis
- Can be combined with other axes
- No realignment
- Low maintenance
- Long operating life and high reliability
- Extremely precise and fast positioning
- Smooth running
- High stroke speed
- Compact design, consequently small space requirements
- Optimum accuracy

2.4 General layout of the linear motor axes

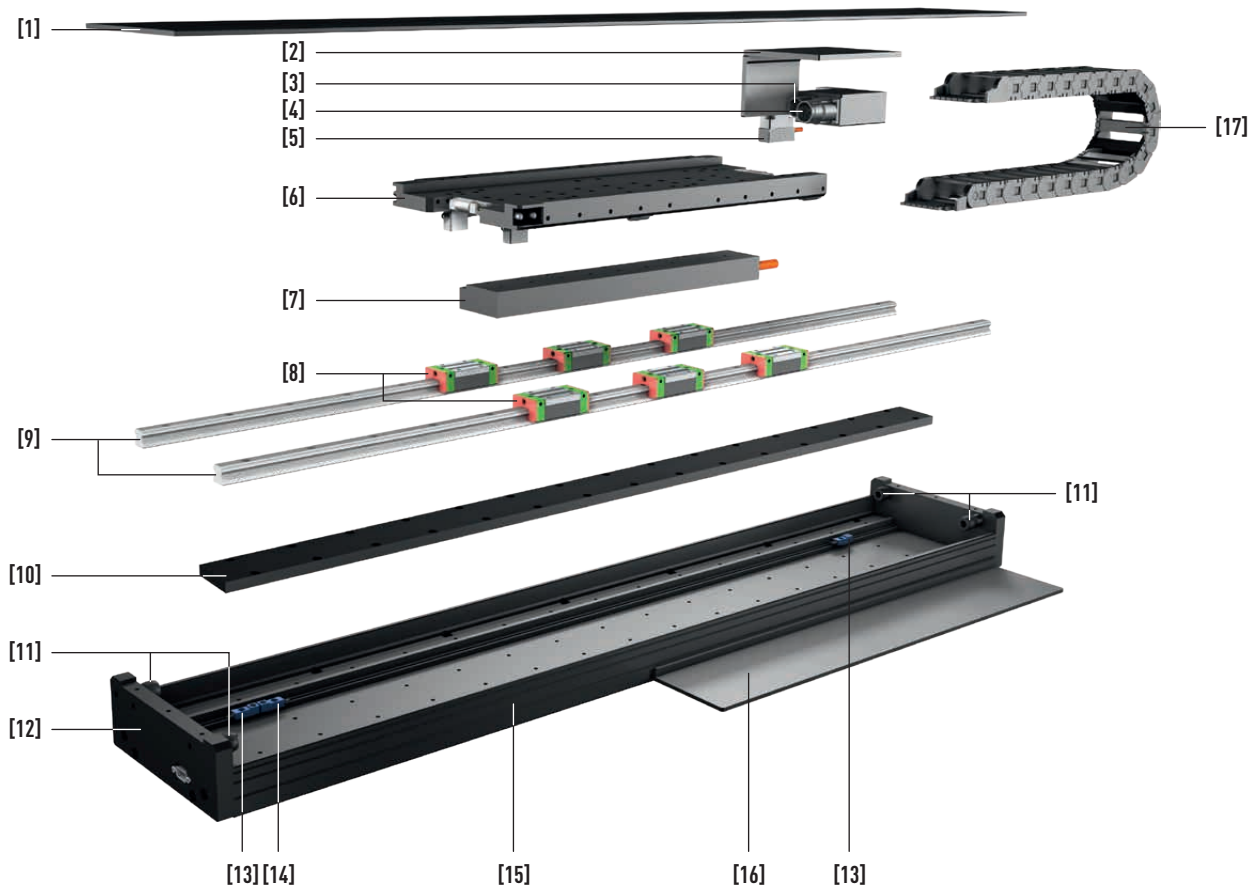

Table 2.1 Main components of the linear motor axis system

Pos.	Component	Pos.	Component
1	Sheet metal cover	10	Stator (secondary part of linear motor)

Linear Motor Systems

Linear motor axis LMSSA

3. Linear motor axis LMSSA

3.1 Properties of the LMSSA linear motor axes

LMSSA linear motor axes are a cost-effective variant of this product group. The cost advantage is achieved by a consistent reduction to the essentials and a limitation of the options and variants available as standard. This allows manufacturing costs to be significantly reduced, while the LMSSA axes simultaneously offer all the advantages of a conventional linear motor axis.

- Short delivery time
- Max. acceleration 100 m/s²
- Max. velocity 5 m/s
- Up to 3,000 mm long

Linear guideway

A high quality HIWIN double guide transfers forces and torques reliably from the carriage into the axis profile. Each carriage comes with four blocks that are guided over two parallel high precision rails. The SynchMotion™ technology with ball chain also ensures a high level of synchronism and quiet running for all sizes.

Electrical interface

Motor and encoder cables are routed out directly on the traversing carriage in a cost-optimized manner and are supplied with open cable ends. The limit switch cables are also led out with open cable ends at the front of the axis.

Distance measuring systems

The distance measuring system, that is integrated into the interior of the axis in order to save space, determines the repeatability. Various measuring systems are available, depending on the requirements for measuring method, interface and resolution.

Colour

In addition to the standard grey version (anodized aluminium), the linear motor axis is also available in a black version.

Linear motor

The integrated HIWIN linear motors ensure dynamic and precise positioning. The iron-core LMSA motors are the first choice when high feed forces are required, the ironless motors are the first choice for applications with the highest synchronization requirements.

Cover

The steel cover strip protects the inside of the axis against dust and dirt.

Linear Motor Systems

Linear motor axis LMX1A

4. Linear motor axis LMX1A

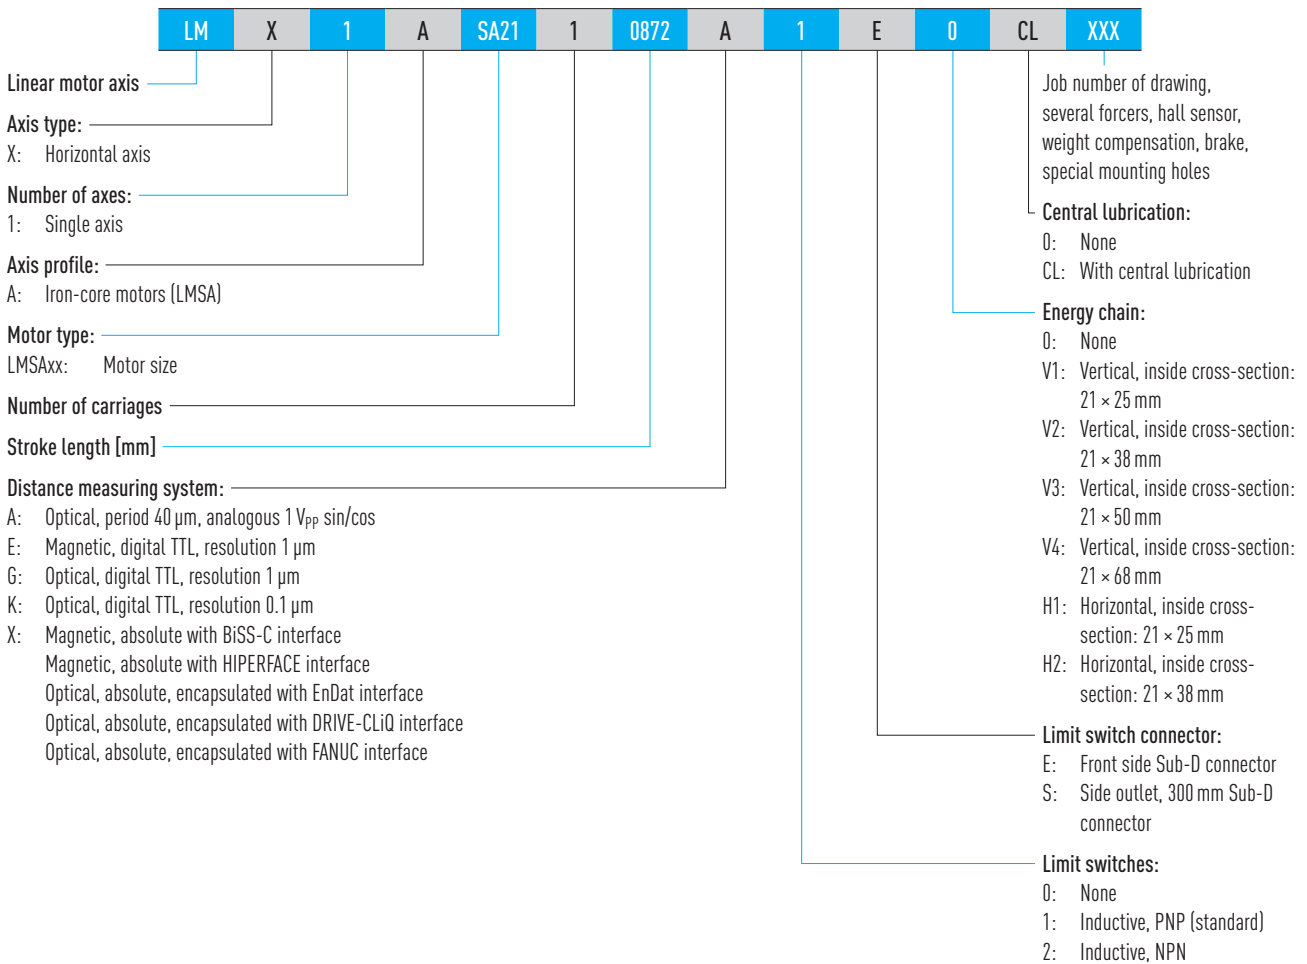

4.1 Properties of the LMX1A linear motor axes

LMX1A linear motor axes are equipped with an iron-core motor, which provides substantial continuous force. They can also be used in cross tables. The stroke length is measured via the optical or magnetic distance measuring systems incrementally or absolutely. The LMX1A linear motor axes have a very compact design and are available in overall lengths up to 4,000 mm.

- Max. acceleration 50 m/s²
- Max. speed 5 m/s
- Up to 4,000 mm long

Linear Motor Systems

Linear motor axis LMX1E

5. Linear motor axis LMX1E

5.1 Properties of the LMX1E linear motor axes

LMX1E linear motor axes are equipped with a coreless motor and are well suited for applications with a high degree of synchronous operational requirements. They can also be used in cross tables. They are distinguished by their very flat design. The stroke length is measured incrementally or absolutely via optical encoders. The LMX1E linear motor axes have very high dynamics and are available in overall lengths up to 4,000 mm.

- Max. acceleration 100 m/s²
- Max. speed 5 m/s
- Up to 4,000 mm long

Linear Motor Systems

High-speed linear motor axis LMV

6. High-speed linear motor axis LMV

6.1 Properties of the LMV linear motor axes

The new generation of small- to medium-load LMV linear motor axes was developed specifically for “more compact, lighter, and highly dynamic” solutions. The considerably reduced moving masses and the new linear motors from the LMSA series gave rise to a highly dynamic positioning axis that can bring its advantages to bear for both horizontal and vertical applications. Unlike other linear motor axes, the HIWIN linear motor axis LMV is characterised by maximised mechanical stability in a compact, weight-optimised design.

The QE series linear guideways featuring tried-and-tested SynchMotion™ technology have been optimised for high synchronism, speed, and acceleration; minimum noise emissions; and very long relubrication intervals. The extremely compact and virtually wear-free weight compensation operates with a magnetic constant force spring or pneumatic cylinder for the best dynamic properties in vertical applications.

Advantages of the LMV vertical axis

- Highly dynamic positioning axis, for vertical and horizontal applications
- Repeatability 0.005 mm with absolute distance measuring system
- Compact, zero-play setup
- Minimised cycle times
- Maximised mechanical rigidity
- Protected against dust
- Maximum process reliability and service life thanks to wear-free drive

8. Gantry system LMG2A-C

8.1 Properties of the LMG2A-C gantry systems

The standardized gantry systems of the LMG2A series are systems with one-sided step bearings. The LMG2A-C type has coreless linear motors.

- Equipped with coreless linear motors
- Slight inertia and fast acceleration
- No cogging
- Stiff aluminium bridge

8.2 Order code for LMG2A-C gantry systems

9. Customized positioning systems

The standardized positioning stages shown in this catalogue are designed to handle many different kinds of positioning tasks. For positioning tasks that cannot be solved using standard stages, application engineers are available to work out an optimized solution.

A few customized solutions are shown on the next four pages.

9.1 Examples

Economic installation and inspection

XY gantry systems make many applications extremely economical. Setup of the gantry from standard components.

- Standard axis of the LMX1L series
- Repeatability $\pm 2 \mu\text{m}$
- Supplied with machine bed

Micro shapes and macro shapes

Milling and microstructures with cutting tools and lasers are application areas in which gantry systems can deliver a number of benefits. They are also an excellent buy for your money.

- Coreless LMC motors
- Repeatability $\pm 2 \mu\text{m}$
- Tried and tested technology with high output

Wafer quality control at the highest level

High precision X-Y Stages with air-cushions are the prerequisites for surface monitoring, which even find the smallest errors, for example, in wafer production for the electronics and chip industries.

- Flatness $\pm 2 \mu\text{m}$
- Repeatability $\pm 0.5 \mu\text{m}$
- Accuracy $\pm 2 \mu\text{m}$
- Resolution 5 nm

Linear Motor Systems

Customized positioning systems

Microsystem technology and wafer processing

Absolute precision and suitability for clean room conditions are the prerequisites for every drive in microsystem technology and wafer processing. Linear motor X-Y Stages are ideal for these tasks.

- Stroke 200 × 200 mm, optional 300 × 300 mm
- Flatness ± 4 µm across the complete stroke
- Repeatability ± 1 µm across both axes
- Accuracy ± 4 µm across both axes
- Clean room suitability class 100, optional class 10
- Optionally suitable for vacuums up to 10⁻³ mbar

Overview for laser scanners

High degree of synchronization and extended operating lives are a must for optical inspection systems such as laser scanners. Linear motors with air bearings fulfil these requirements.

- No friction thanks to air bearings
- No cogging thanks to coreless linear motors
- Stroke length up to 1,500 mm

Photovoltaic-panel assembly

High dynamic positioning of silicium cells for 24 hours each day.

- Linear motors also in vertical axes enable a long durability
- Vertical axes with adjustable mass compensation and clamping element for emergency-stop

X-ray-inspection of printed circuit boards

Delivery of the whole linear-motor-system consisting of Linear motor axis, drives, cables for an inline inspection machine.

- System with coreless LMC components
- Stroke 550 × 550 mm
- Repeatability ± 1 µm
- High dynamism in spite of 100 kg mass to move

Automatic assembly

Dynamic Assembly of circuit boards in fully automated assembly lines.

- Gantry system with LMS components and KK stage (axis Z)
- Stroke $650 \times 660 \times 135$ mm. Options include longer travel distances along the lower axis
- Acceleration 20 m/s^2
- Flatness $\pm 20 \mu\text{m}$
- Rectangularity 0.01°
- Interferometrical survey of the axis
- Delivery ready assembled in the base frame

Moveable Saw

Linear motor axis enables the cutting during the transport of bars.

- Customised LM system with LMS47D
- Cycle time approx. 1.3 s (mass: 55 kg, stroke length: 1.5 m)
- Speed 3 m/s
- Acceleration 22 m/s^2

Film transport

Film transport Compact and flat linear motor axis with high power density integrated in the production line.

- Two parallel LMC axes
- Stroke length 300 mm
- All components assembled on a customised base frame 600×500 mm

Laser trimming with maximum precision

Optimal results make a high demand on evenness and rectangularity on a large stroke. The metal particles of the laser machining necessitate the bellow cover.

- Cross table with bellow cover
- Stroke 700×750 mm
- Repeatability $\pm 2 \mu\text{m}$
- Flatness $\pm 0.01/300$ mm
- Rectangularity ± 5 arc-sec

Linear Motor Systems

Customized positioning systems

Dispenser

Highest requirements on the flatness.

- Stroke of cross table: $150 \times 250 \times 60$ mm
- High rigidity of the lower axis due to the steel frame
- Upper axis stiffened by aluminium profile
- Creation of a calibration chart to compensate the deviation of the flatness
- Flatness $\pm 10/300$ mm
- Repeatability $5 \mu\text{m}$

Laser scripting

High accuracy due the use of glass scales.

- Customised LMC linear motor system
- Stroke 400×110 mm
- Lower axis positions the workpiece. Upper axis operates the laser
- Repeatability $\pm 1 \mu\text{m}$
- Rectangularity $8 \mu\text{m}$
- Flatness $\pm 5 \mu\text{m}$

Laser exposure

Excellent results enabled due to the very smooth motion of the coreless linear motor axis.

- 4 forcers on each axis
- High degree of synchronization due to the use of special linear guideways
- Optimised adaptation of the axis profile to the existing machine frame

We live motion.
